SHIV LAUNCHER

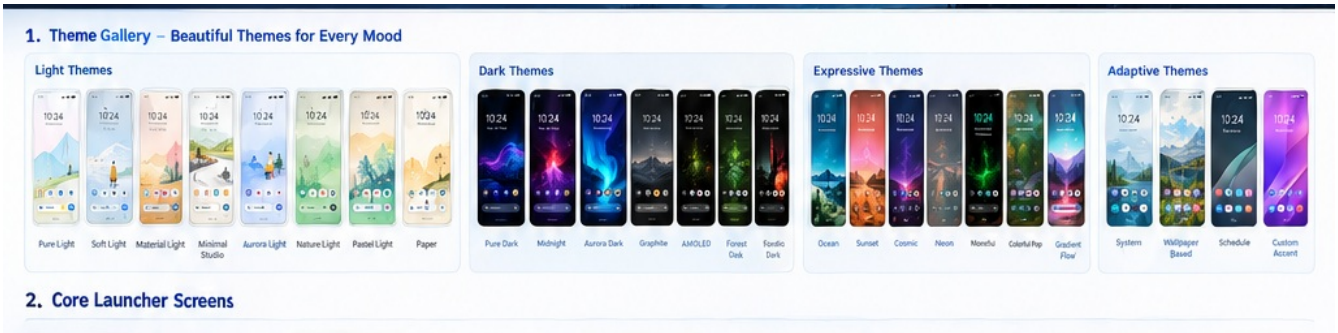

UI screens • Theme concepts • Animations • Button behavior

Design reference for a customizable Android launcher integrated with ShivAI, SHIV Identity, and SHIV DB & Auth. The visual board is a concept reference; exact implementation must follow the existing codebase and verified backend capabilities.

SHIV Launcher
Your World. Your Way.
Smart • Secure • Customisable • AI Powered
One Launcher. Infinite Possibilities.
Unified with
ShivAI
SHIV Identity
SHIV DB & Auth
1. Theme Gallery – Beautiful Themes for Every Mood
Light Themes
Dark Themes
Expressive Themes
Adaptive Themes
2. Core Launcher Screens
Splash Screen
Onboarding
Home Screen
Aprawer
Search
SHIV AI Chat
Multimodal Composer
Customization Studio
Settings
3. Experience Profiles – Tailored for Every User
Everyday
Fast access & simplicity
Student
Study & focus
Teacher
Teaching & organization
Designer
Creative workflows
Video Editor
Production tools
Marketer
Campaign management
Developer
Coding & technical
Business Owner
Daily operations
Executive
Productivity & meetings
Creator
Content production
Family
Shared device
Accessibility
Large icons & clarity
4. ShivAI – Multimodal AI Workspace
Text+Animations
Document Analysis
Voice Interaction
Coding Assistant
3. Experience Smooth, Purposeful, Beautiful
App Opening
Smooth scale + fade
Folder Opening
Expand animation
App Drawer
Slide up transition

Additional options
7. Key Features & User Flow
1. Sign In
Secure login using SHIV Identity
2. Personalize
Choose theme & profile
3. Explore
Use launcher & ShivAI
4. Customize
Adjust layout, icons, widgets
5. Be Productive
Get AI help & smart tools
AI Assistant
Embedded in launcher
Secure Account
SHIV Identity + Auth
Cloud Sync
SHIV DB
Privacy Controls
Cross-Device
SHIV Launcher
More than a launcher. It's your intelligent workspace.
Different people. Different goals. One powerful launcher.

1. Theme Gallery

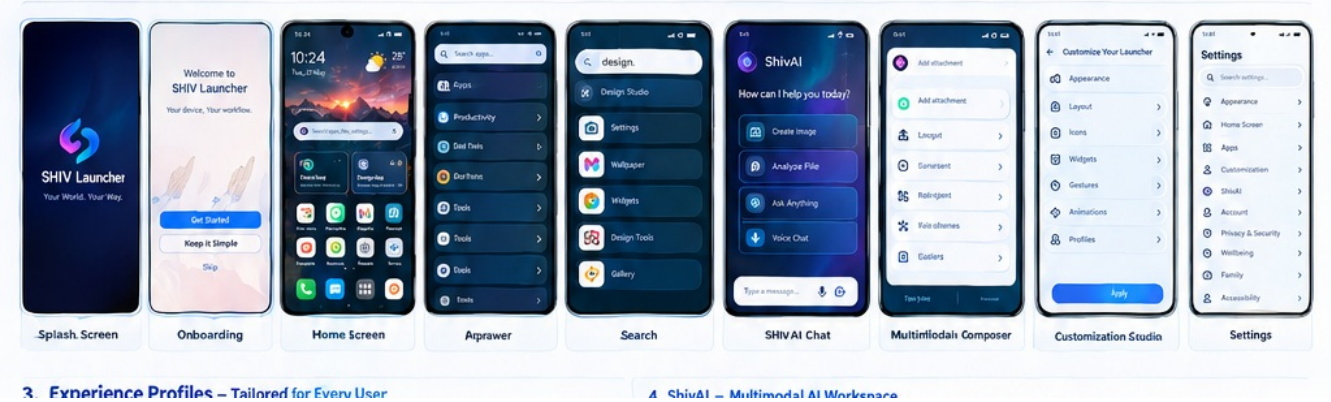

Use one shared design-token system so the launcher, customization studio, settings, and ShivAI workspace change appearance consistently. Keep light themes readable and dark themes high-contrast.

Theme family	Examples	Expected behavior
Light	Pure Light, Soft Light, Material Light, Minimal Studio, Aurora Light, Nature Light, Pastel Light, Paper	Bright surfaces, dark readable text, subtle borders, controlled accent colors.
Dark	Pure Dark, Midnight, Aurora Dark, Graphite, AMOLED, Forest Dark, Studio Dark	Readable text, clear surfaces, visible focus and disabled states.
Expressive	Ocean, Sunset, Cosmic, Neon, Glass-inspired, Monochrome, Colorful Pop, Gradient Flow	Optional visual personality; effects must be performance-aware.
Adaptive	Follow system, wallpaper-based, scheduled light/dark, custom accent	Use only supported Android behavior and explain launcher-only styling.

2. Core Launcher Screens

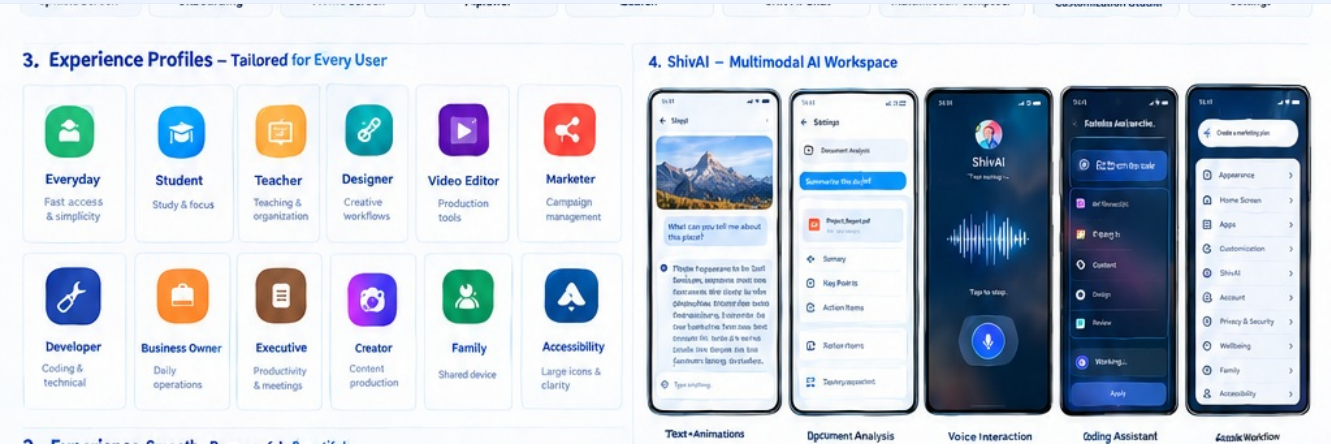

Recommended screen inventory. Keep common actions visible and label important controls clearly. Screens shown in the image atlas are illustrative, not pixel-perfect final designs.

Screen	Primary controls	Expected action
Onboarding	Get Started, Keep It Simple, Skip	Set up experience level and preferences; allow skipping.
Home	App icons, dock, search, optional ShivAI shortcut	Open apps; search locally; enter AI only when requested.
App drawer	Search, category/filter, app item	Find and launch installed apps.
Universal search	Search field, result rows	Search apps/settings/launcher items locally; AI search is a separate action.
Customization Studio	Appearance, Layout, Icons, Widgets, Gestures, Animations, Profiles, Apply	Preview changes; Apply commits; Cancel discards pending edits.
Settings	Search settings, categorized rows	Open specific settings and preserve a clear back path.

3. ShivAI Multimodal Workspace

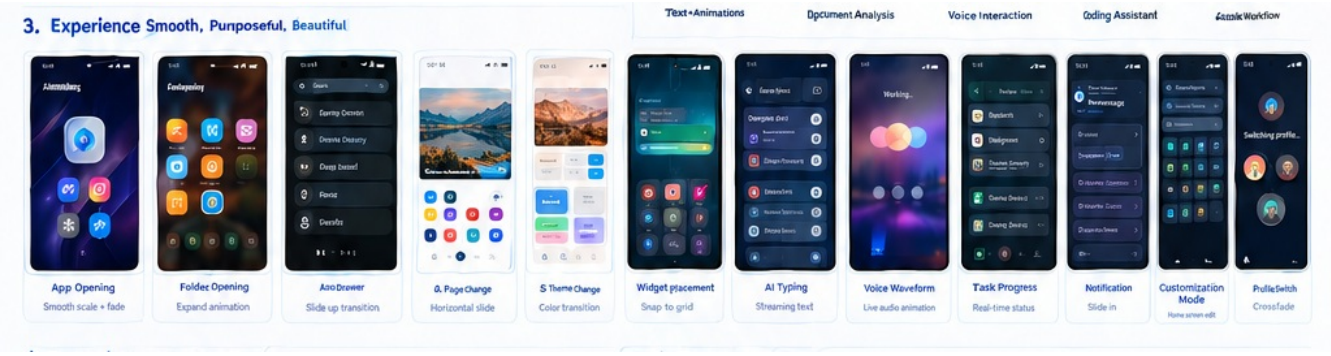

The AI interface must connect to real ShivAI backend capabilities. Only display modalities and actions that are actually supported by the backend and Android client.

UI element	Behavior
Message composer	Text input, Send, Stop/Cancel while generating, Retry after failure. Preserve unsent text on errors.
Attachment button	Opens supported file picker or camera flow. Show preview, upload status, remove/replace, and errors.
Image/PDF/document cards	Show actual selected file and processing status. Do not claim analysis before a successful backend result.
Voice controls	Clear idle/listening/recording/playing states. Ask permission at the point of use; provide stop and cancel.
Agent selector	Use actual agent IDs/capabilities discovered in backend; hide unavailable agents.
Task progress	Show true backend states; no fake progress percentages or simulated completion.
Sources and artifacts	Show citations, files, tables, code or other structured outputs only when actually returned.

4. Animation & Motion Specification

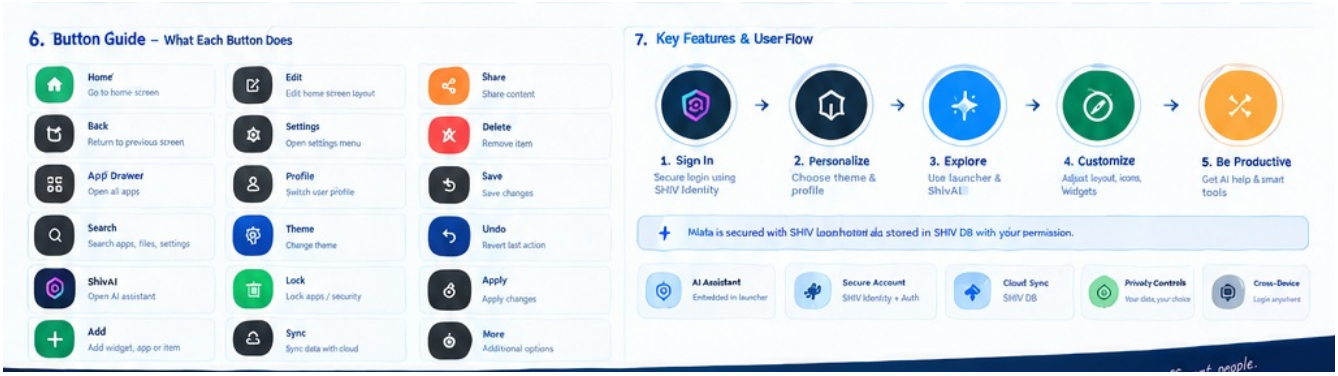

Use a centralized motion system with consistent durations and easing. Animations should explain state changes, not delay work. Respect Android reduced-motion preferences and low-end device performance.

Trigger	Animation	Behavior / guardrail
Tap app icon	Quick scale/press feedback; app transition if supported	Never delay launch for decoration.
Open folder	Short scale/expand transition	Keep contents readable and accessible.
Open app drawer	Subtle slide/fade	Maintain search focus and back behavior.
Swipe home page	Smooth horizontal page transition	Avoid excessive parallax; support reduced motion.
Enter customization	Panel or sheet transition	Show clear Edit/Apply/Cancel states.
Preview/apply theme	Coordinated color/surface transition	No flicker; apply all screens using design tokens.
Attach file	Attachment card appears with real upload status	No fake progress; allow removal/cancel when supported.
AI streams response	Text appears as it arrives	Do not animate text that has not been received.
Voice input	Waveform while capture is active	Show truthful microphone state and stop control.
Task changes state	Status indicator and concise label transition	Use real backend task state; no invented percentage.
Profile switch	Brief crossfade or slide	Preserve state and avoid leaking another profile's data.

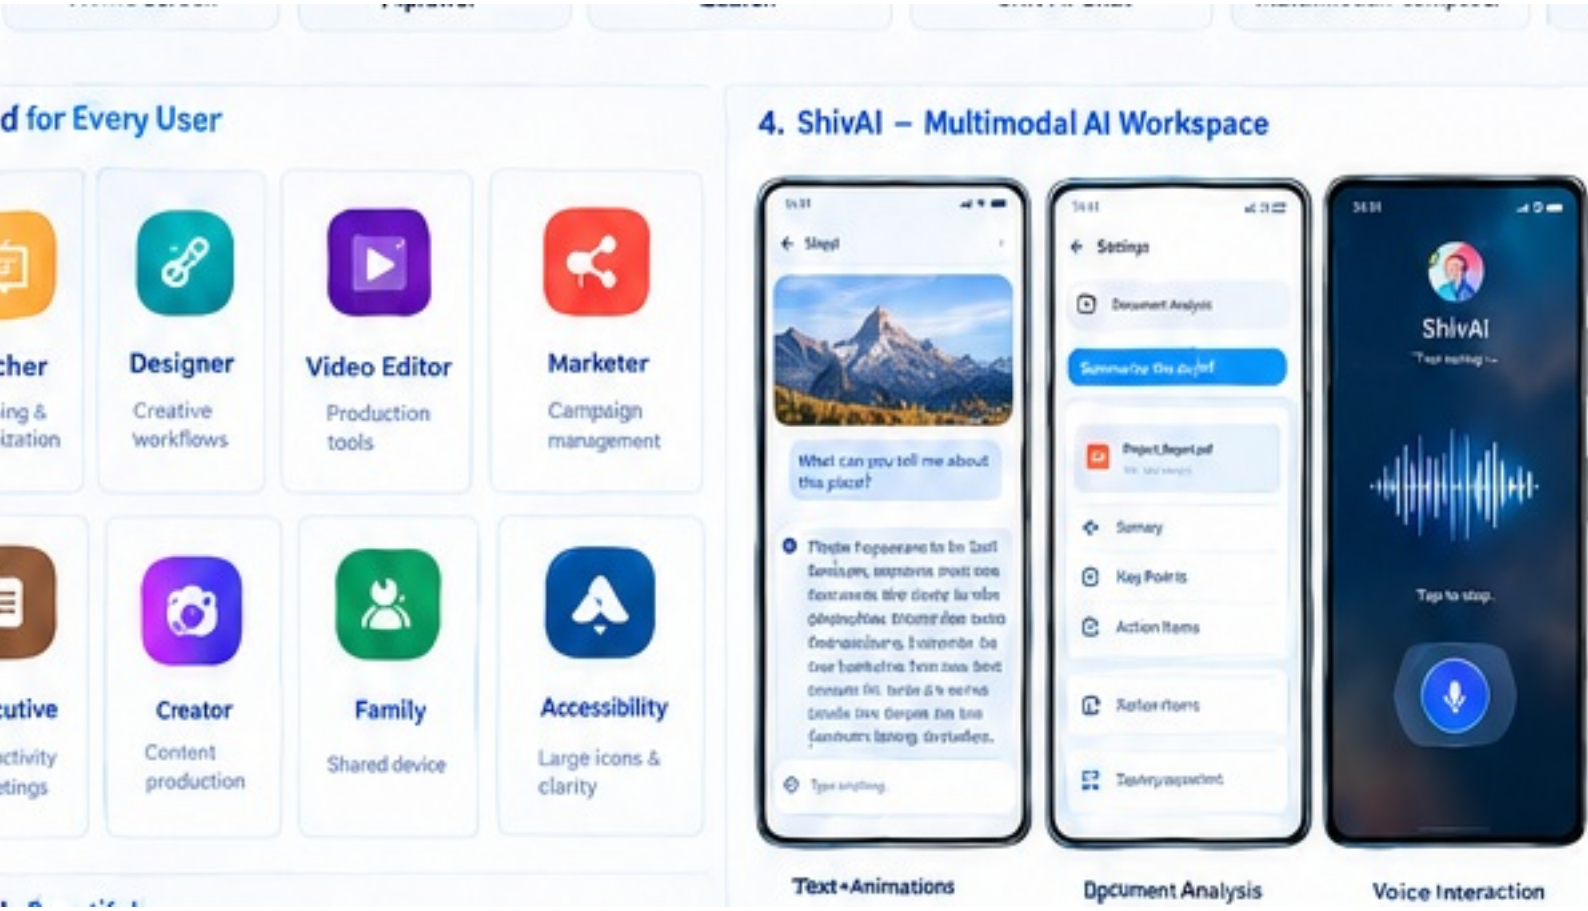

5. Button & Gesture Guide

The exact button labels may vary with the implementation, but every visible control must have a defined, testable action. Avoid buttons that are decorative or silently fail.

Control	Action	Important behavior
Home	Return to launcher home	Preserve expected navigation state.
Back	Return to previous screen/state	Do not unexpectedly discard unsaved edits.
App Drawer	Open installed-app list	Search should be available quickly.
Search	Search apps/settings/launcher items	Local search should not require AI or internet.
ShivAI	Open AI workspace	Authenticate and call the real backend as required.
Add / Widgets	Open widget/app placement flow	Show only supported widgets and available apps.
Edit / Customize	Enter customization mode	Make editable elements and controls obvious.
Theme	Open theme gallery or theme editor	Preview first; apply only when selected.
Apply	Commit pending customization	Persist settings and show truthful success/error.
Cancel	Discard current uncommitted changes	Confirm if meaningful user work would be lost.
Undo	Reverse the last supported edit	Only show when an undo operation is available.
Save	Save current layout/theme/profile	Validate and persist; explain failures.
Sync	Sync supported data with SHIV DB services	Show real sync state; preserve local data on failure.
Lock	Open app-lock/security controls	Use platform-supported protection; explain limitations.
Profile	Switch experience/layout profile	Do not assume profession or restrict general features.
Attach	Select an image/document/audio/video if supported	Only expose supported types; show preview and upload state.
Microphone	Start/stop voice capture	Permission required; visible and truthful capture state.
Send	Submit message to ShivAI	Prevent accidental duplicate submissions; preserve text on failure.
Stop	Cancel generation/task if supported	Reflect actual cancellation result.
Retry	Retry a failed request	Use a safe retry strategy and avoid duplicate side effects.
Settings	Open settings	Use clear categories and searchable settings.
More	Open additional actions	Keep secondary actions discoverable and relevant.

6. Profiles & User Experience

Profiles are starting points, not separate locked products.

Provide optional Everyday, Student, Teacher, Designer, Video Editor, Marketer, Developer, Business Owner, Executive, Creator, Family, and Accessibility layouts. Users can combine, rename, duplicate, and reset profiles. Only show installed apps and verified tools. Never infer a user's profession as a permanent identity.

Recommended first-run flow

Step	Screen / choice	Expected result
1	Welcome	Explain the launcher briefly; allow Skip.
2	Experience level	Simple, Balanced, Advanced; all remain changeable.
3	Starter layout	Choose a profile or start blank.
4	Appearance	Choose a theme, wallpaper, icon size, and motion preset.
5	SHIV account	Offer sign-in when needed; explain benefits and privacy.
6	Permissions	Request optional permissions only when a feature needs them.
7	Home screen	Finish setup and let the user start using the launcher.

7. Integration & Acceptance Checklist

ShivAI

■ Verify actual endpoints and schemas. ■ Connect streaming and cancellation where supported. ■ Integrate only verified agents and modalities. ■ Show truthful task status. ■ Handle errors without losing unsent user content. ■ Preserve citations when supplied by the backend.

SHIV Identity, Auth & DB

■ Reuse canonical identity. ■ Use documented authentication and session flows. ■ Enforce server-side authorization. ■ Do not embed privileged database credentials in the APK. ■ Isolate user data. ■ Handle logout/account switching. ■ Synchronize only supported data. ■ Preserve local preferences through network failures.

Themes and motion

■ Light and dark themes are readable. ■ Shared design tokens are used across launcher and ShivAI. ■ Theme choices persist. ■ Custom theme files are validated. ■ Reduced motion is respected. ■ No long blocking startup animation. ■ Low-end device performance is checked.

Quality gates

■ Build succeeds. ■ Relevant automated tests pass. ■ Test login/logout and account isolation. ■ Test offline behavior. ■ Test theme switching and persistence. ■ Test attachment failure and recovery. ■ Test accessibility with large text and screen readers. ■ Report UI-only, incomplete, and blocked features honestly.

Status note: this PDF is a visual concept and interaction specification. It is not evidence that any screen, animation, API integration, or backend capability has already been implemented. Use it alongside the actual repository audit and verify each feature in the running app.
